

1 Using **AND**

AND will narrow your search to find fewer results. Results must have both keywords in them to be retrieved

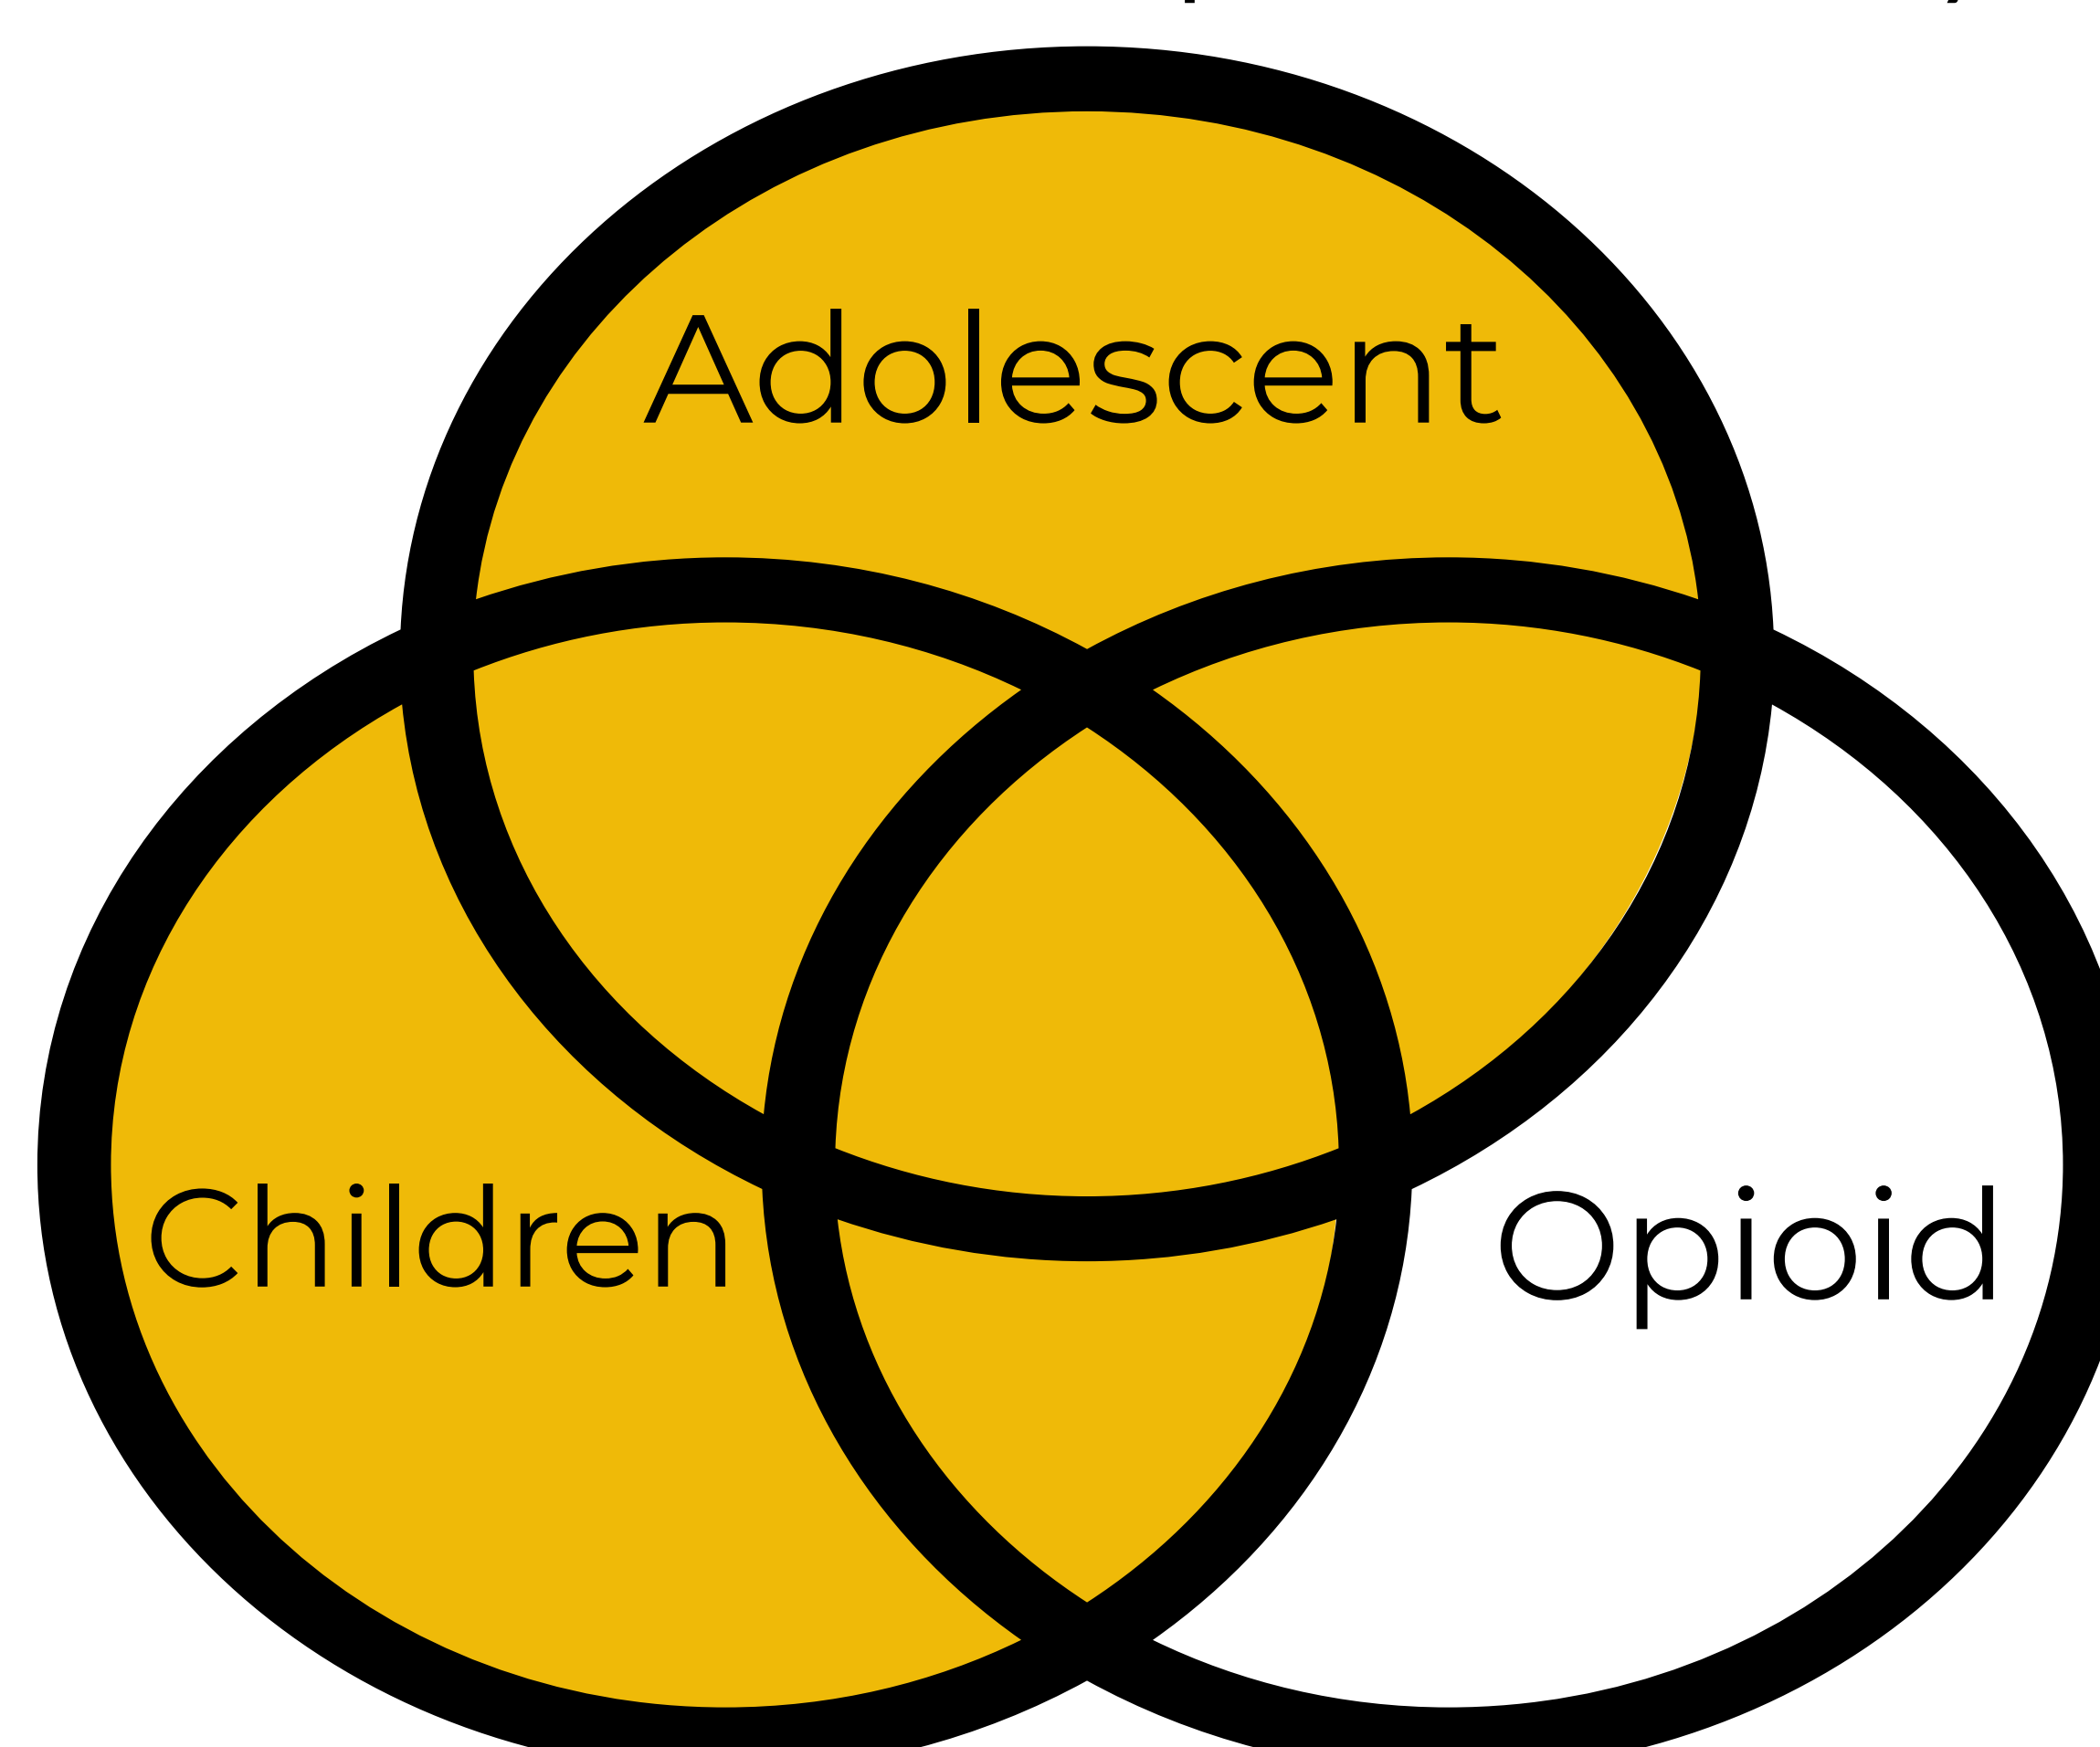

2 Using **OR**

OR will expand your results to help you find more articles. Results can use either term so this works great with related concepts.

3 Nesting your connectors

You can bundle your keywords together using parentheses to specify an order of operations for the database. This can expand or narrow your search.

(Adolescent OR children) AND opioids
